

Story-at-a-Glance

CABG and Angioplasty are complex treatment modalities available to treat Coronary Artery Disease.

Compare to other invasive procedures, EECP as non-invasive, is cost effective and available in many centers.

Many clinical papers and publications are available about EECP treatment.

Why Some Cardiologist Don't Advise Vaso-meditech EECP to Heart Disease?

Coronary artery disease is a very complex disease. So the management is also complex. The management of coronary artery disease is (CABG) bypass surgery and (PTCA) angioplasty both are complex treatment modality. So EECP is a simple non-invasive solution, when compared to the complex intervention solution offered by the cardiologist it is also cost effective and it can be easily reproduced in many centers.

I think this has created the kind of bias in cardiologist mind. And also the EECP clinical papers and guidelines are all very recent. From 2013-2016 many clinical papers have been published. And many cardiologist text book and guidelines have recommended EECP treatment. So most of the cardiologist now will not have looked at EECP or read EECP in their standard curriculum. And possibly this is what the cardiologist is biased about the treatment, because they haven't have this curriculum during their clinical education.

And second important question is because now it is been recommended by the guidelines and text book. I think your cardiologist when you speak about your heart disease should also discuss about EECP as optional for your cardiac disease. If the cardiologist or interventional cardio-thoracic surgeon refuses to discuss EECP then probably they are withholding some information from you. Which may be very helpful for your heart disease management.

So even if your cardiologist doesn't advice EECP. I think as a patient,you should ask about EECP as an option and let the cardiologist explain to you. So right now because of the high recommendation for EECP, the cardiologist should not refuse and if they refuse, I think they are not giving all the information about the treatment option which is available to you. And it is hard to see in spite of so much of publication and supported by the government and insurance only a very less number of patient are benefiting by this very effective treatment. So we advice as a patient you have all right to ask your cardiologist and get the information about EECP. If not you can always have EECP information from (heal your heart) centre. And take a second opinion from any of our EECP centre across the country.
